EXPERIENCE

Stripe | Seattle, WA

June 2025 - Present

Senior Software Engineer

- Led a company-wide reduction and cleanup of production IAM roles, using an AI-driven pipeline to analyze and safely remove thousands of roles in 4 months with zero user impact.
- Created an agentic workflow that analyzed code to classify IAM roles, applied classification-specific prompts to determine required permissions, and autonomously created pull requests with the resulting code changes.
- Designed a deterministic validation gate for AI-generated changes, replacing unreliable LLM self-review with programmatic checks that hard-stopped invalid changes.
- Added orphaned resource cleanup to a reconciliation system designed to replace all terraform IaC across the company; eliminating hundreds of hours of toil cleaning up unused resources from drifted terraform stacks.
- Migrating a legacy Airflow execution layer from dedicated hosts to dynamic pod workers in Kubernetes to reduce infra costs by multiple \$MM.

Amazon Web Services (AWS) | Seattle, WA

April 2020 - June 2025

Software Engineer II

- Led the redesign of Amazon Linux's global release system, migrating a 4-day, console-driven process to AWS Step functions and CDK, reducing release time to 6 hours (94%).
- Built a Python CLI that codified the Amazon Linux release process, replacing an ad-hoc console workflow and tribal knowledge with a repeatable, self-service engineering tool.
- Owned production releases across all AWS regions and partitions, coordinating releases of AL1, AL2, AL2023, and internal variants under strict deadlines.
- Maintained the security of globally distributed Amazon Linux releases, patching critical CVEs and participating in the chain of trust for embargoed security releases including the Linux kernel, `sudo`, and `log4j`.
- Automated operational workflows across AWS partitions using Rust, Python, and Bash.
- Mentored engineers across the team, including managing an intern who converted to full-time and mentoring a junior engineer into a more technical role.

Starry | Boston, MA

February 2019 - April 2020

System Software Engineer

- Implemented backbone fiber network fail-over with Python and networkd.
- Designed and implemented SSH-based remote device support system for technicians, using Rust and gRPC.
- Wrote Rust and C++ firmware for embedded devices that power Starry internet.

Google | *Software Developer Intern* | Montreal, QC

August 2018 - November 2018

Microsoft | *Software Engineer Intern* | Redmond, WA

May 2018 - July 2018

Intuit | *Software Engineer Co-op* | San Diego, CA

July 2017 - December 2017

Kinto Care | *Full Stack Engineer Co-op* | Boston, MA

July 2016 - January 2017

Beechwood Software | *Software Engineer Intern* | Boston, MA

January 2015 - July 2016

SIDE PROJECTS

Fuel Crisis (2026 GMTK Game Jam Entry)

July 2026

- Designed, programmed, and animated a complete 3D puzzle game in Godot and Blender for the GMTK Game Jam; ranked in the top 20% of 10,000+ entries

Way Cooler (Wayland Window Manager)

July 2016 - January 2020

- Independently created tiling Wayland window manager with 6,000+ downloads and 2,000+ stars on GitHub.
- Designed a programmable interface using Lua that extends a basic compositor core in Rust.

COMPUTER KNOWLEDGE

Languages: Python, Rust, Go, Java, Javascript, Typescript, C, C++, Bash, Lua

Cloud & Infra: AWS, CDK, Kubernetes, Docker, systemd

Distributed Systems: Step Functions, gRPC, Airflow

Databases & Web: PostgreSQL, Flask, NGINX

EDUCATION

Northeastern University | Boston, MA

September 2014 - May 2019

Bachelor of Science in Computer Science
